

## **PRACTICAL-1.1**

**AIM: Installation & Configuration of Android Studio. Along with its all major Gradle, SDK, AVD etc.**

### **THEORY:**

#### **1. Android Studio**

- As we know Android world is increasing day by day. Billions of Android apps has been published on Google Play store. So it is the need of time that we should learn some basics of Android development. Android Studio is an IDE (Integrated Development Environment) for Android application development.

#### **2. Features of Android Studio**

- Following are some interesting features of Android Studio:
- It provides a flexible Gradle-based build system.
- It also support C++ and NDK
- Run your app without building a new APK.
- Provides a virtual device to run and test your app

#### **3. Installation**

- Follow steps below for complete installation and configuration of Android Studio.

##### **Step 1) Download Android Studio**

You can download Android Studio from this link or go to [developer.android.com](https://developer.android.com) homepage and search for downloads. Choose appropriate platform either for Windows, Mac or Linux. Following are the pre requirements for windows operating system.

->Pre-requirements

Microsoft windows 7/8/10 (32 or 64

bits) Minimum 3GB RAM

(recommended 8GB) 2GB disk

space

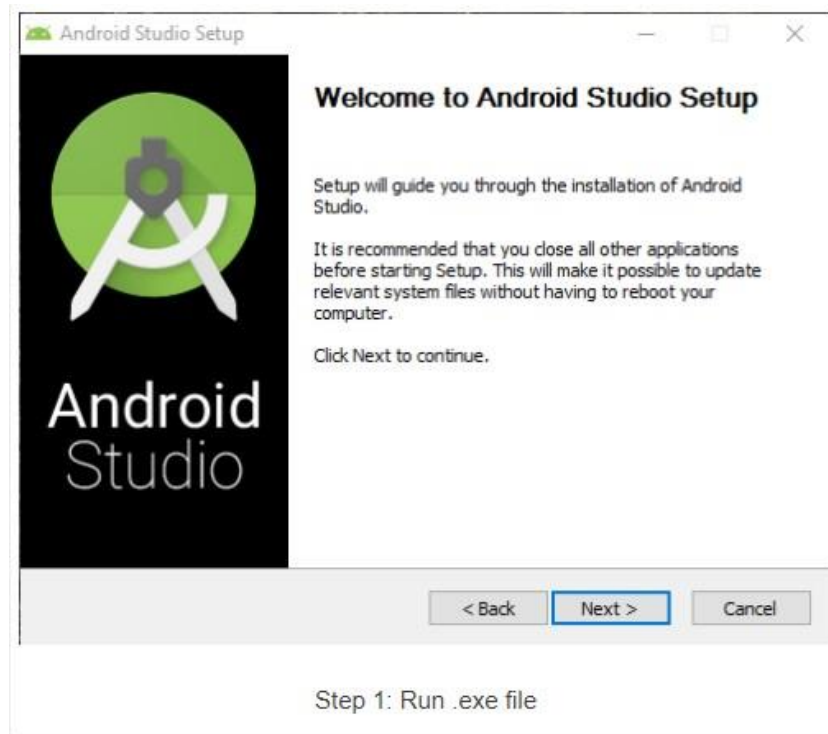

1280 x 800 minimum screen

resolution size Intel processor for

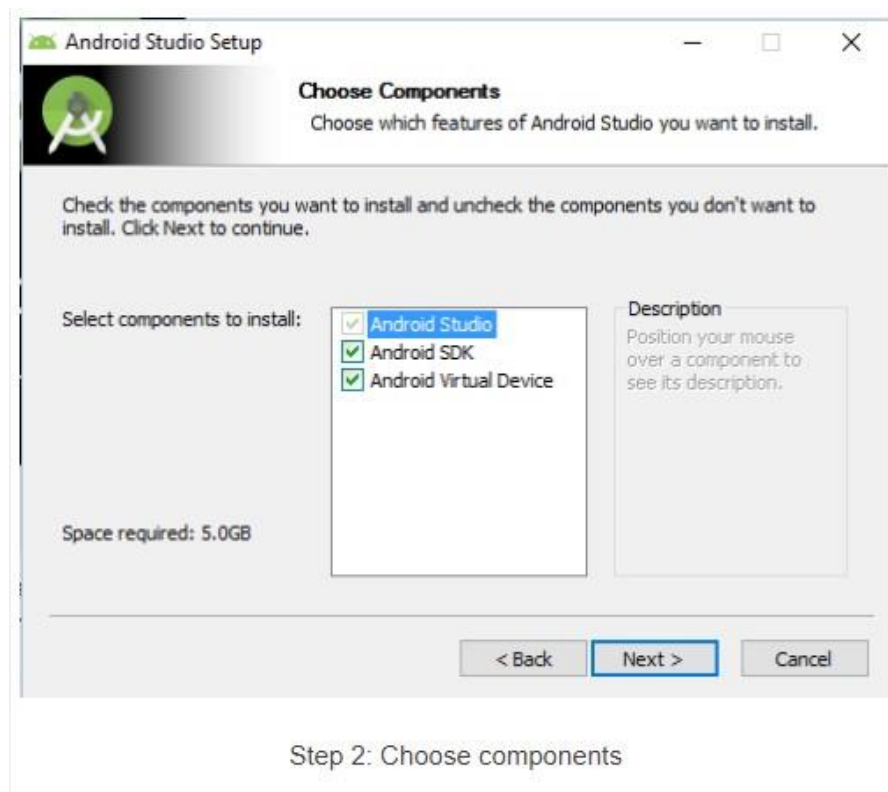

accelerated emulator Android SDK

##### **Step 2) Run .exe file**

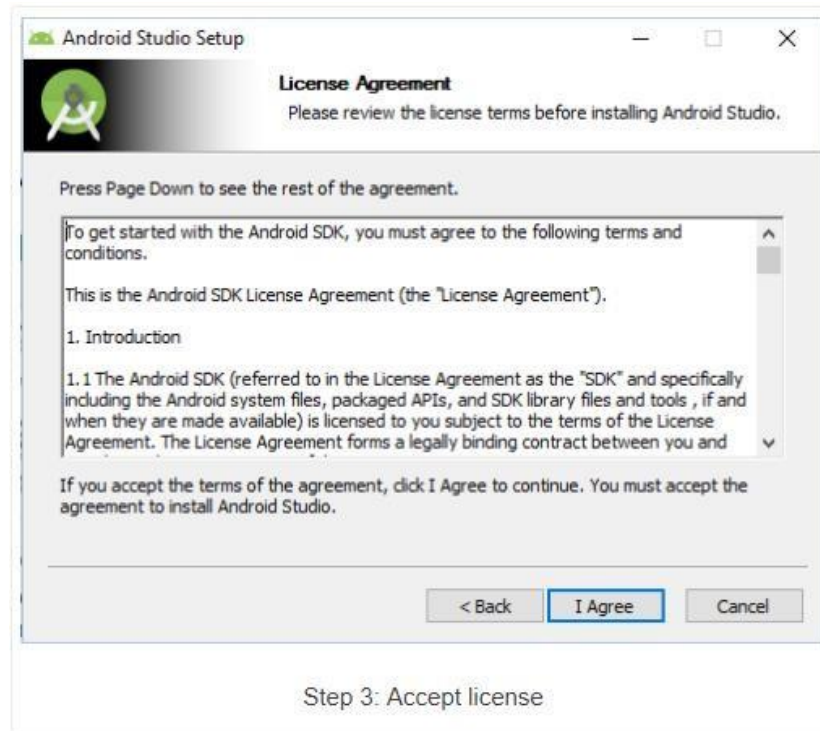

Now the next step is to launch .exe file you just download. Following screen will appear

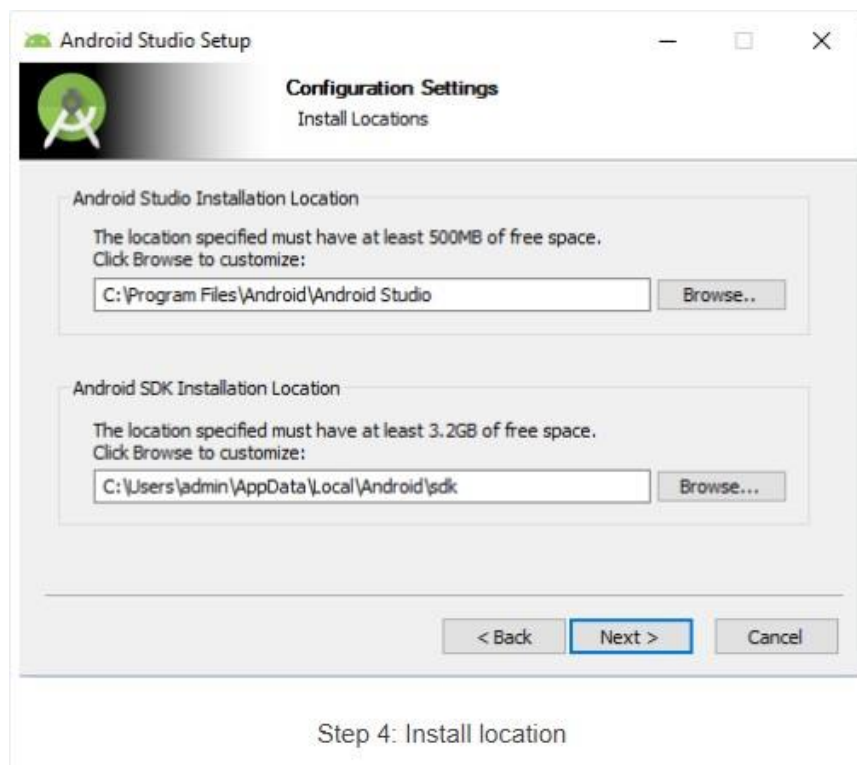

Click next and select Android SDK checked if you dont have it already. Better is to leave the default settings.  
Make sure Android virtual device is also checked.

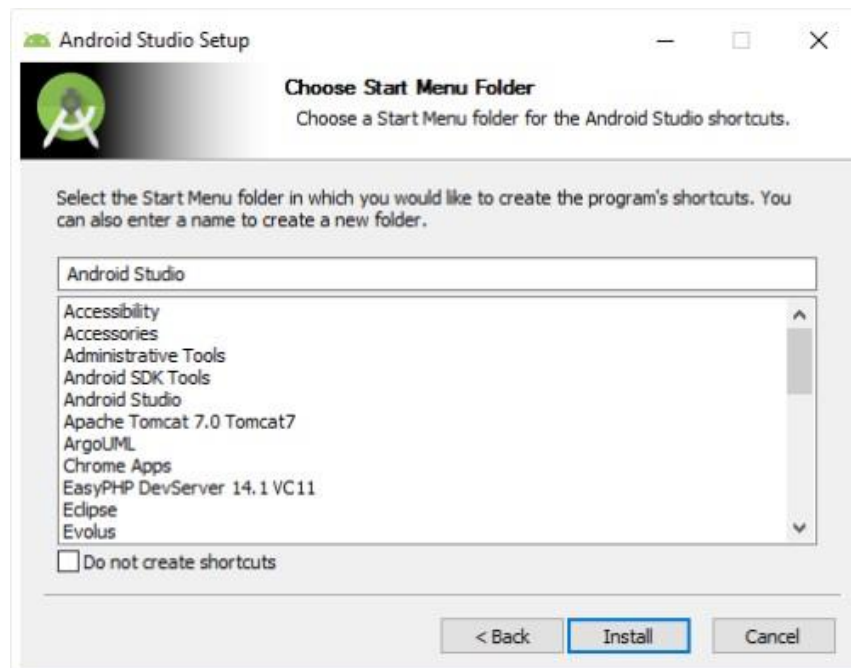

Next step is to accept license and agreement. Click on I Agree

Next step is to set location of installation. Please make sure your disk has minimum required space before clicking on Next. For Android Studio installation location must have at least 500MB free space. For Android SDK installation, selected location must have at least 3.25GB free space.

Next step is to choose the start menu folder, where you want to create shortcut. If you don't want to create a shortcut just mark Do not create shortcut.

Step 5: Choose start menu folder

And hit Install button.

It will start installation. Once its done following window will appear.

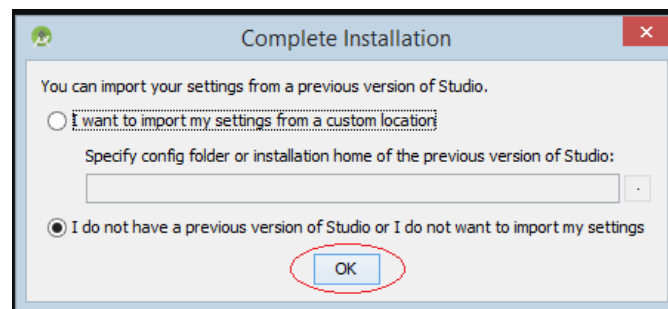

Step 6: Finish

This informs you installation has completed. Click Finish. Make sure Start Android Studio is checked. Following splash screen of Android Studio will appear.

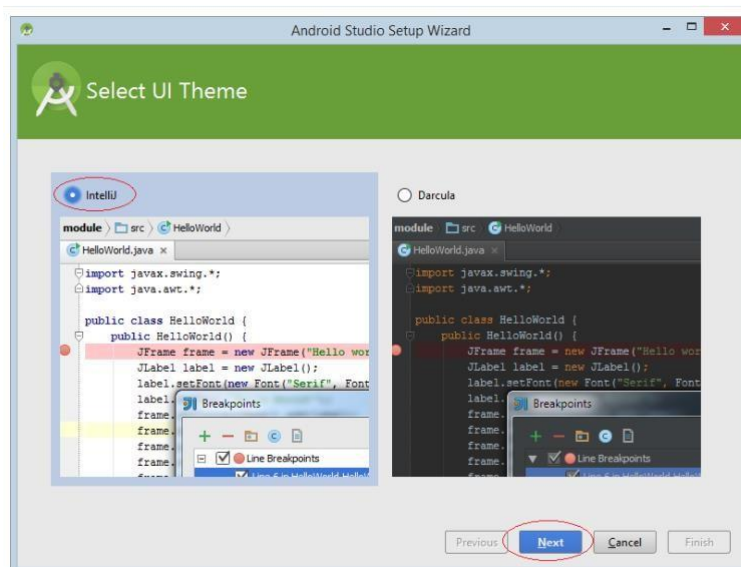

### Step 3) Configure Android Studio

When you run it for the first time it will ask for Android Studio settings.

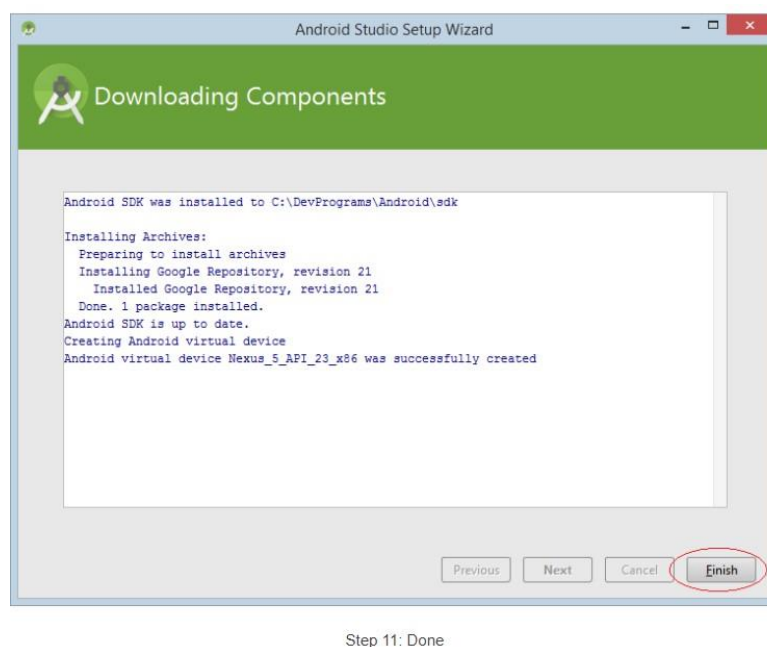

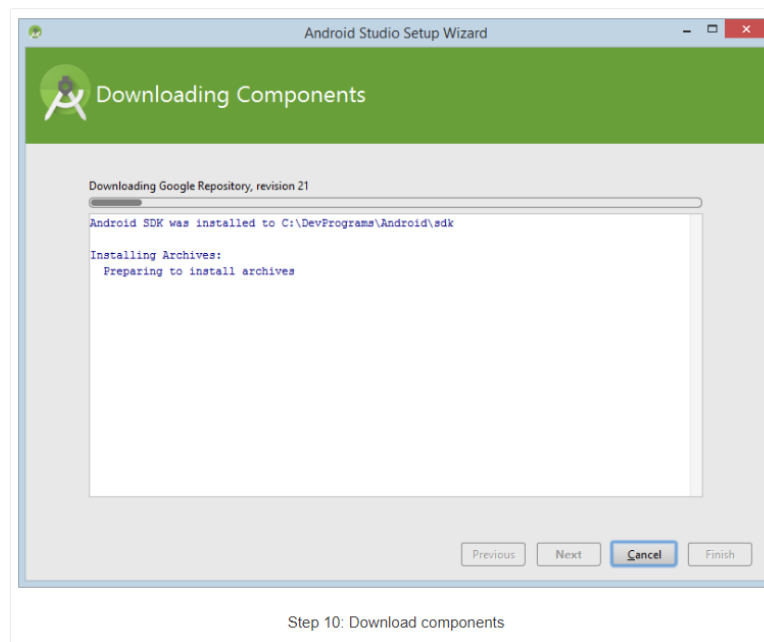

If you don't have any previous settings click on the second option Select a theme and click next.

Step 9: Select theme

At the very first run it needs to download some necessary components, wait till it completes. And its all done.

Click on Finish and start building your Android apps.

#### 4. Gradle

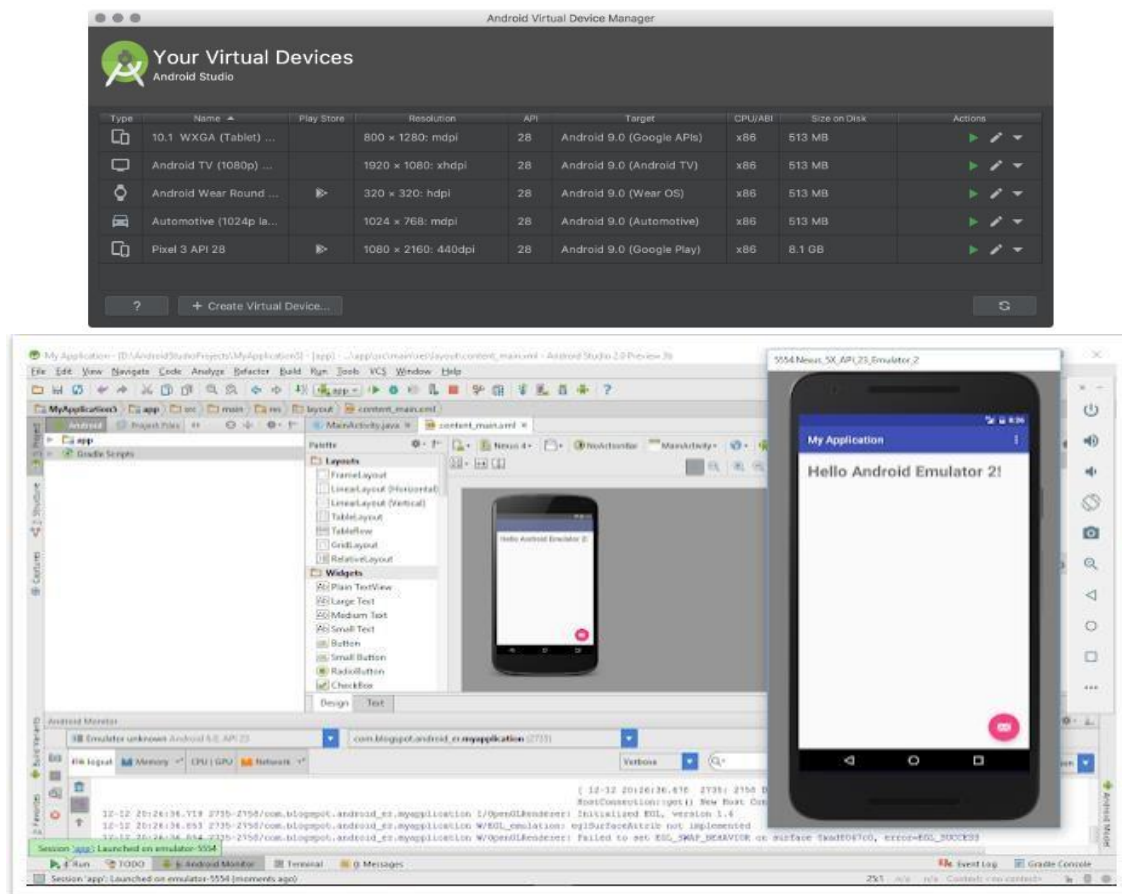

- Gradle implements a concept referred to as convention over configuration. This simply means that Gradle has a pre-defined set of sensible default configuration settings that will be used unless they are overridden by settings in the build files. This means that builds can be performed with the minimum of configuration required by the developer. Changes to the build files are only needed when the default configuration does not meet your build needs.

## 5. SDK

- The Android SDK (software development kit) is a set of development tools used to develop applications for Android platform. The Android SDK includes the following:
  - Required libraries
  - Debugger
  - An emulator
  - Relevant documentation for the Android application program interfaces (APIs)
  - Sample source code
  - Tutorials for the Android OS

## 6. AVD

An Android Virtual Device (AVD) is a configuration that defines the characteristics of an Android phone, tablet, Wear OS, Android TV, or Automotive OS device that you want to simulate in the Android Emulator. The AVD Manager is an interface you can launch from Android Studio that helps you create and manage AVDs.

**PRACTICAL-1.2**

**AIM: Introduction to Android and Create “Custom Message” application. That will display “Custom Message” in the middle of the screen in the Black color with the Yellow background.**

**activity\_main.xml File:-**

```
<?xml version="1.0" encoding="utf-8"?>
<androidx.constraintlayout.widget.ConstraintLayout
xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:app="http://schemas.android.com/apk/res-auto"
    xmlns:tools="http://schemas.android.com/tools"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:background="#ffff00"
    tools:context=".MainActivity">
```

```
<TextView
    android:id="@+id/textView3"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:text="@string/cstmsg"
    android:textColor="@color/black"
    app:layout_constraintBottom_toBottomOf="parent"
    app:layout_constraintEnd_toEndOf="parent"
    app:layout_constraintStart_toStartOf="parent"
    app:layout_constraintTop_toTopOf="parent" />
```

```
<TextView
    android:id="@+id/textView2"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:layout_marginBottom="69dp"
    android:text="VRUSHANG (19DCE089)"
    android:textSize="20sp"
    android:textStyle="bold"
    app:layout_constraintBottom_toBottomOf="parent"
    app:layout_constraintEnd_toEndOf="parent"
```

```
        app:layout_constraintStart_toStartOf="parent" />
</androidx.constraintlayout.widget.ConstraintLayout>
```

**MainActivity.java File:-**

```
package com.example.custommessage;

import androidx.appcompat.app.AppCompatActivity;

import android.os.Bundle;

public class MainActivity extends AppCompatActivity {

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_main);
    }
}
```

**strings.xml File:-**

```
<resources>
    <string name="app_name">Custom Message</string>
    <string name="cstmsg">Custom Message</string>
    <string name="black">#000000</string>
</resources>
```

**Output:-**

**Conclusion:-** In this practical, I learned how to change background color & add a new color to the project, also learned to edit layout a bit.

**PRACTICAL-2.1****AIM: Design an application representing a simple calculator.****activity\_main.xml File:-**

```
<?xml version="1.0" encoding="utf-8"?>
<androidx.constraintlayout.widget.ConstraintLayout

        click();
    }

    public void click()
    {
        radioGroup.setOnCheckedChangeListener(new
```

```
RadioGroup.OnCheckedChangeListener() {
    @Override
    public void onCheckedChanged(RadioGroup radioGroup, int i) {
        switch (i)
        {
            case R.id.radioButton1:
                Toast.makeText(MainActivity.this, "Computer Engineering !!!",
                    Toast.LENGTH_LONG).show();
                break;
            case R.id.radioButton2:
                Toast.makeText(MainActivity.this, "Information Technology !!!",
                    Toast.LENGTH_LONG).show();
                break;
            case R.id.radioButton3:
                Toast.makeText(MainActivity.this, "Computer Science Engineering
                    !!!", Toast.LENGTH_LONG).show();
                break;
        }
    }
});
}

/*
    public void onClickedCE(View view) {
        Toast.makeText(MainActivity.this, "Computer Engineering !!!",
            Toast.LENGTH_LONG).show();
    }
    public void onClickedIT(View view) {
        Toast.makeText(MainActivity.this, "Information Technology !!!",
            Toast.LENGTH_LONG).show();
    }
    public void onClickedCSE(View view) {
        Toast.makeText(MainActivity.this, "Computer Science Engineering !!!",
            Toast.LENGTH_LONG).show();
    }
}
*/
```

Output:-

**Conclusion:-** From this practical, I learned that how to use of Auto Complete Radio View and Radio Button.

        if(res>0)
            return true;
        else
            return false;
    }

    public boolean deleteDB(String id)
    {
        SQLiteDatabase db=this.getWritableDatabase();
        int res=db.delete(tname,"id=?",new String[]{id});
        if(res>0)
            return true;
        else
            return false;
    }
}
```

**Output:-**

**Conclusion:-** From this practical, I learned that how to make Insert, update, Delete and retrieve operation on the SQLite database.

**PRACTICAL-10****AIM: Introduction to I-phone & installation of x-code on MAC.****What is Xcode?**

Xcode is an application that developers use to build apps for Apple's various platforms such as iPhone, iPad, Macs, AppleTV and Apple Watch.

**Step – 0 Check your mac OS Version**

We will be using the latest version of Apple's Xcode 11 to program iOS 13 apps and run our apps in Xcode's built in iOS simulator.

Xcode is an Integrated Development Environment (IDE) developed by Apple and the vast majority of iOS developers rely on it for making iPhone or iPad applications. Xcode 11 can only be installed on a Mac running macOS 10.14.4 (Mojave) or above. But ideally, you should be running macOS 10.15.0 or above Catalina).

If you are still running an earlier OS such as Mavericks, Yosemite, El Capitan, Sierra etc, you will need to update your OS. Have a look on Apple's website for instructions on how to do so.

Check that your OS is either Mojave 10.14.4 or above or Catalina 10.15 If your version is lower than this, head over to the Mac App Store and you can upgrade your operating system to the latest version of macOS Catalina for free.

**Step 1: Open the App Store**

Once you're sure you are running the correct version of the Mac operating system, you can get started with downloading Xcode 11 through the Mac App Store. Open the App Store app on your Mac. By default, the App Store is in the Dock. You can also find it in your Launchpad.

## Step 2: Search for Xcode

In the search field in the top-right corner, type Xcode and press the Return key.

## Step 3: Install Xcode

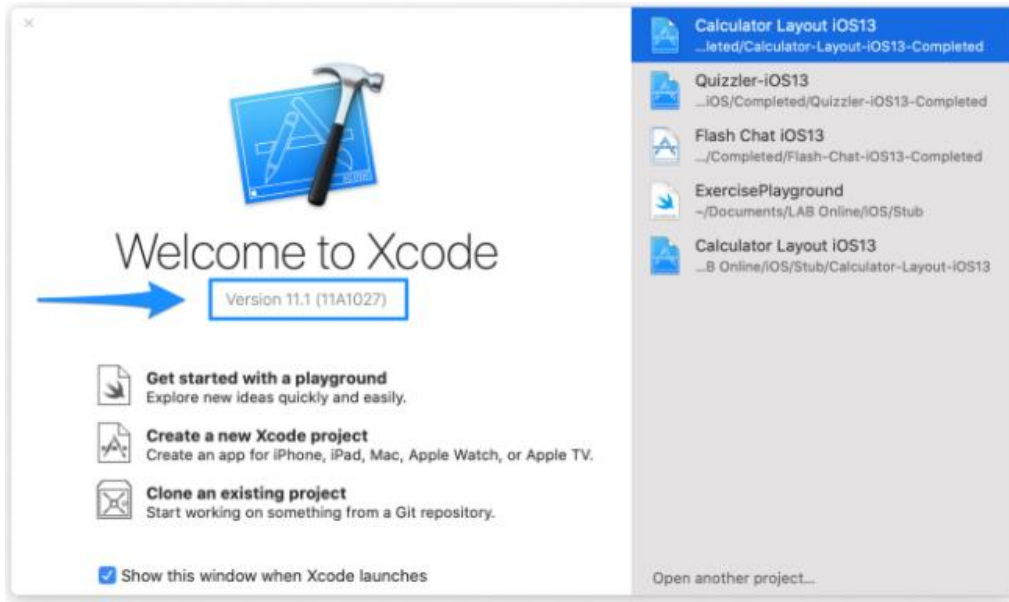

Xcode is a free application developed by Apple, so just click the “Get” or “Download” button and start the installation process.

Xcode is several gigabytes in size so downloading it could take a while. By default, Xcode is downloaded into your /Applications directory.

## Step 4: Launch Xcode

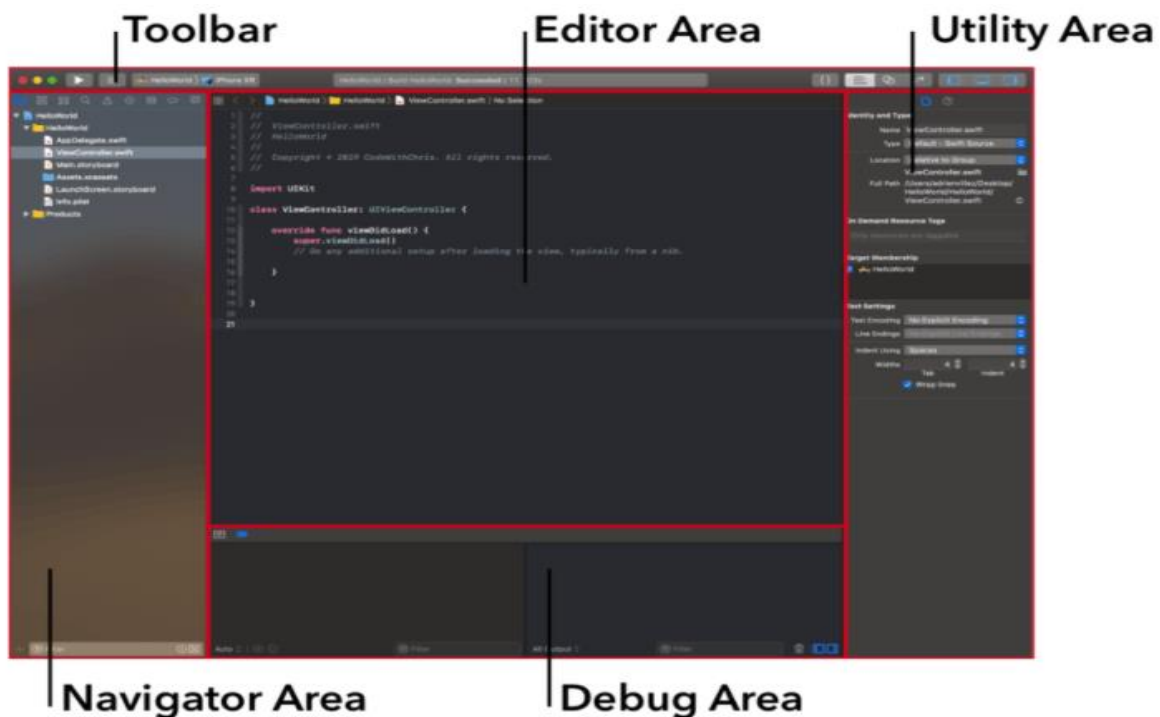

Launch Xcode. Do you see the Welcome to Xcode window and the version is 11.0 or above (e.g 11.1 or 11.1.2 etc.)? If yes, then great, we're all done!

By the end of this chapter, you'll have a great understanding of how to navigate the development environment and how to create your first Xcode project.

Before we dive in, keep this Apple Documentation for Xcode handy.

Let's now look at the diagram below. If your interface looks different, make sure you have Xcode 11 and not an earlier version.

The reason this is a great diagram is because it lets me refer to these different sections of the interface and you can refer back to this diagram to see what I'm talking about!

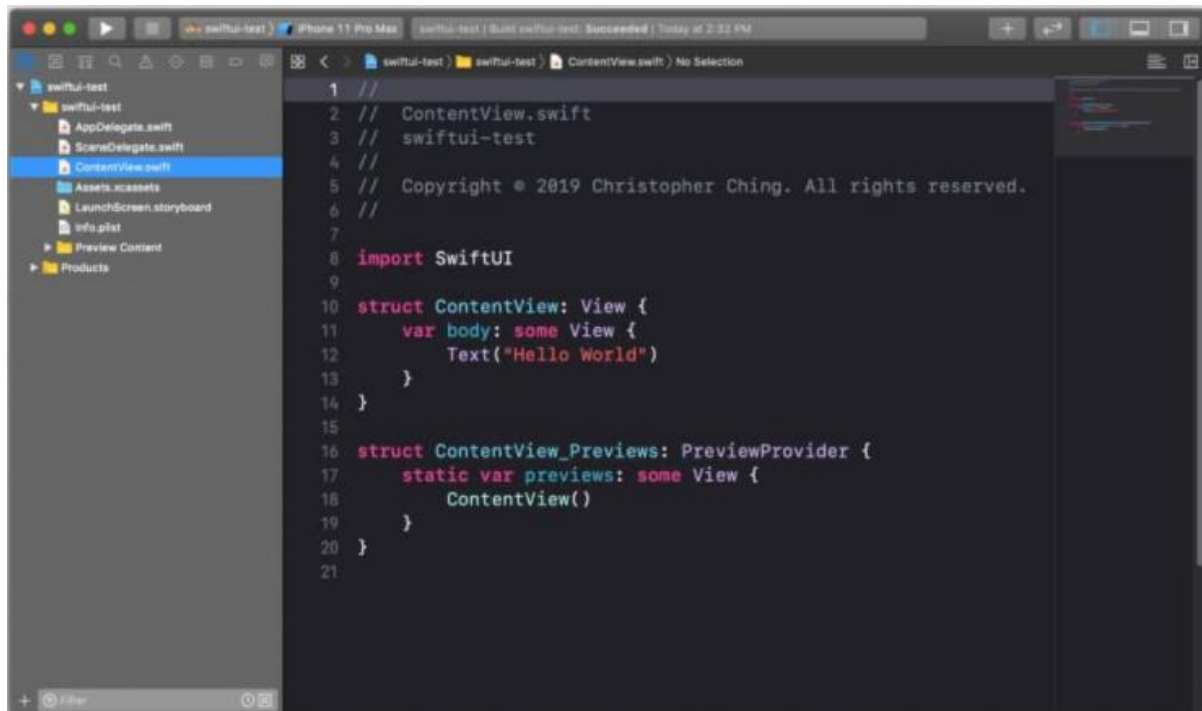

As you can see from the diagram, there are 5 major areas: the Navigator, Editor, Utility Area, Toolbar and Debug Area. We'll cover each area in detail later but for now, let's talk about general navigation of Xcode.

Keep in mind that you can adjust the size of each of those panes by hovering your cursor over the boundaries of each area and dragging.

You can also show and hide the various areas as needed via the "View" buttons in the upper right hand corner:

This can be helpful, for example, when you're writing code and you don't need the debugger area or the utility area. Then you can use the View buttons to hide those 2 panes to give your editor more visible space.

**PRACTICAL-11**

**AIM: Create I-OS application that will display “Custom Message” in the middle of the screen in the Black color with the Yellow background.**

**CODE:**

```
import UIKit

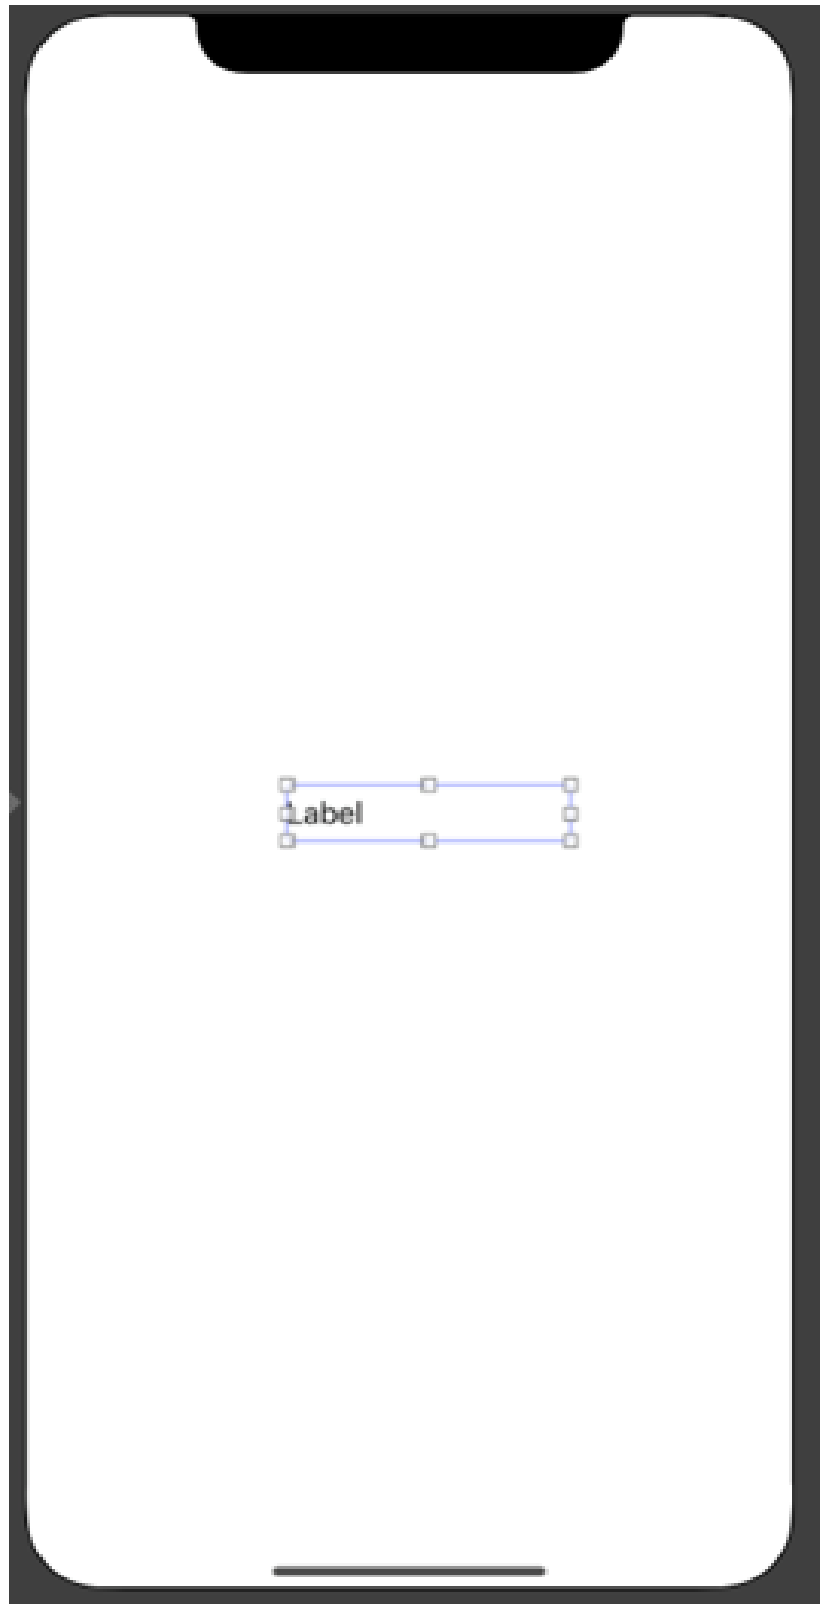

class ViewController: UIViewController {

    @IBOutlet weak var customlabel: UILabel!

    override func viewDidLoad() {
        super.viewDidLoad()

        // Do any additional setup after loading the view.
        customlabel.textColor = UIColor.black
        customlabel.text = "Custome Message"
        self.view.backgroundColor = UIColor.yellow
    }
}
```

**OUTPUT:**

**PRACTICAL-12.1**

**AIM: Create an I-OS application to calculate sum of two numbers and gives result in Toast Message.**

**CODE:**

```
import UIKit

class ViewController: UIViewController {

    @IBOutlet weak var Number1: UITextField!

    @IBOutlet weak var Number2: UITextField!

    @IBOutlet weak var Add: UIButton!

    override func viewDidLoad() {
        super.viewDidLoad()

        // Do any additional setup after loading the view.
    }

    @IBAction func Addclick(_ sender: Any) {
        let a:Int! = Int(Number1.text!)
        let b:Int! = Int(Number2.text!)

        let c = a + b

        //Result.text = String(c)

        Toast(String(c))
    }
}

extension ViewController
{
    func Toast(_ message:String)
    {
```

```
var Toastlabel = UILabel(frame: CGRect(x: self.view.frame.width/2-75, y:  
self.view.frame.height-100, width: 150, height: 40))
```

```
    Toastlabel.textAlignment = .center
```

```
    Toastlabel.text = message
```

```
    Toastlabel.textColor = UIColor.black
```

```
    Toastlabel.backgroundColor = UIColor.red.withAlphaComponent(0.5)
```

```
    Toastlabel.alpha = 1.0
```

```
    self.view.addSubview(Toastlabel)
```

```
    UIView.animate(withDuration: 3.0, delay: 1.0, options: .curveEaseInOut,  
animations: {
```

```
        Toastlabel.alpha = 0.0
```

```
    }) { (isCompleted) in
```

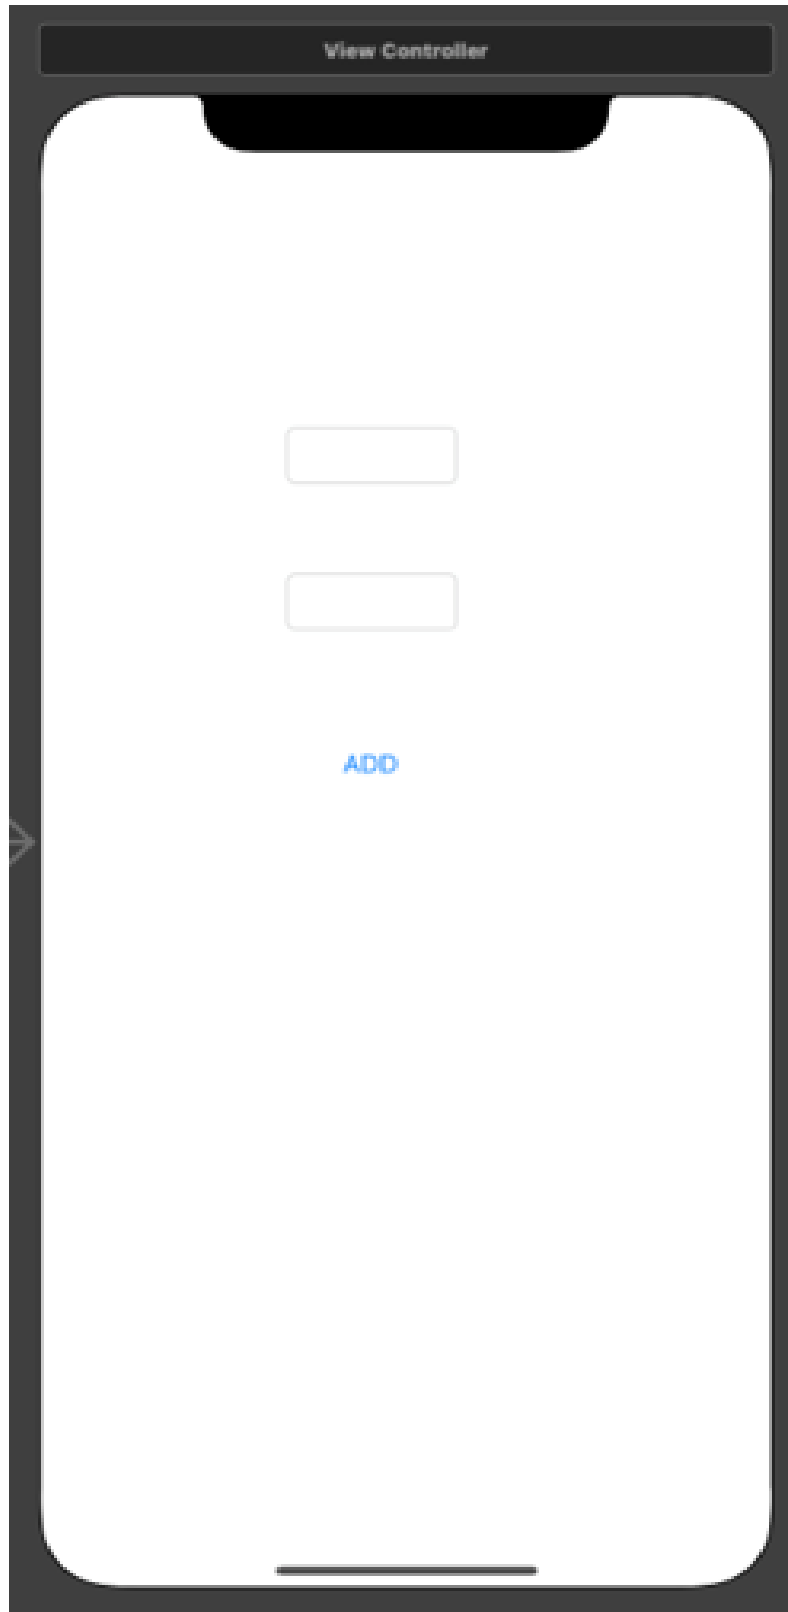

```
        Toastlabel.removeFromSuperview()
```

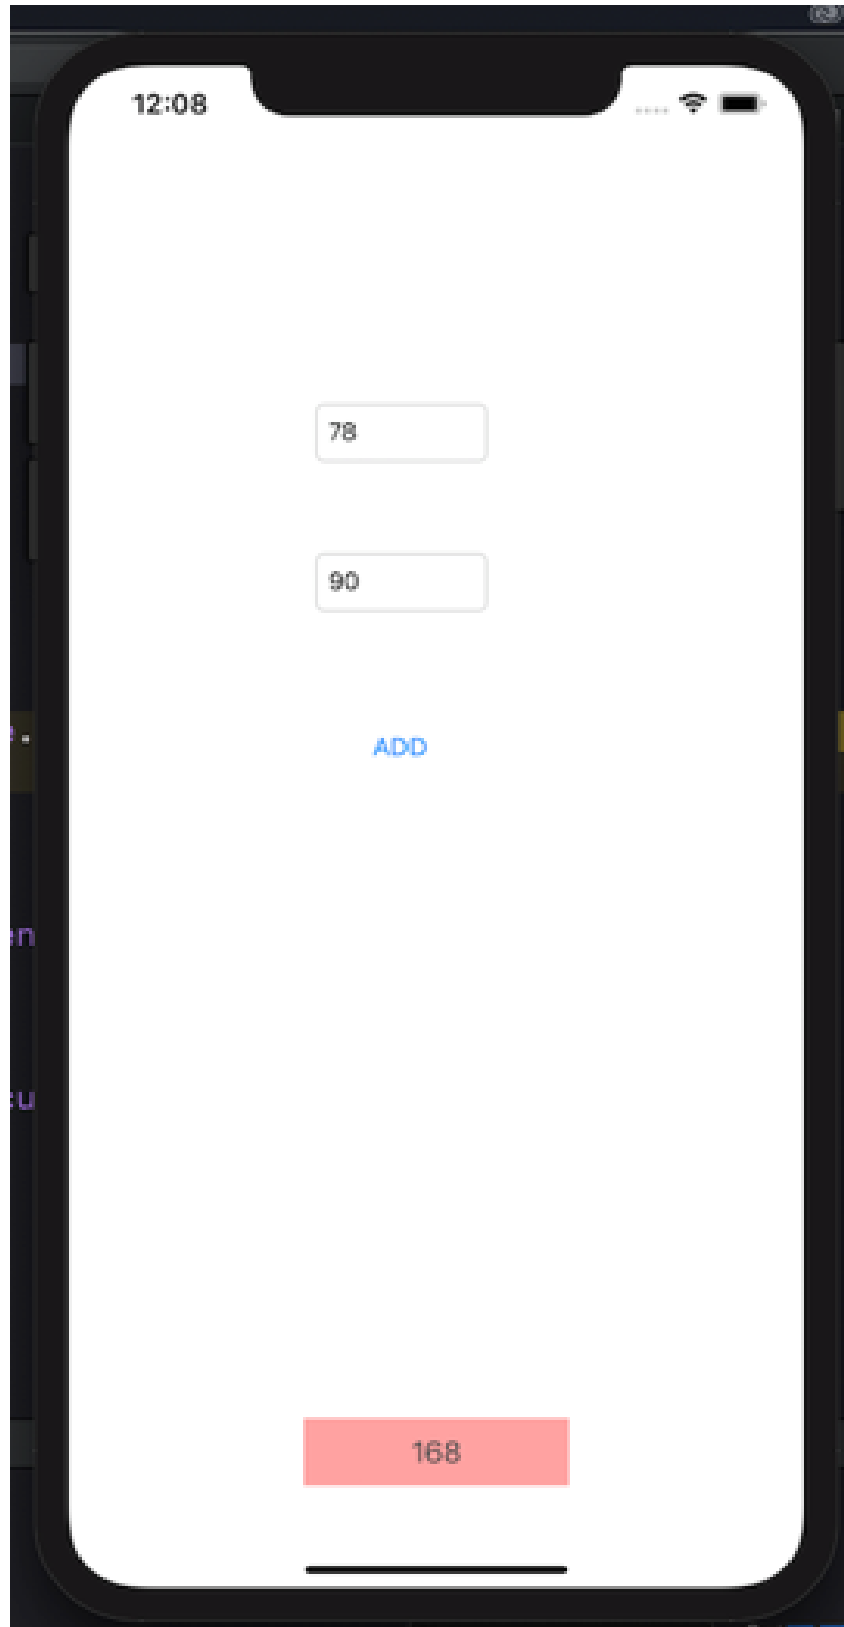

```
    }
```

```
}
```

```
}
```

**OUTPUT:**

**PRACTICAL-12.2**

**AIM: Design an I-OS application representing a simple calculator.**

**CODE:**

```
class ViewController: UIViewController {

    @IBOutlet weak var Number1: UITextField!

    @IBOutlet weak var Number2: UITextField!

    @IBOutlet weak var labelanswer: UILabel!

    @IBOutlet weak var btnadd: UIButton!

    @IBOutlet weak var btnsubtract: UIButton!

    @IBOutlet weak var btnmultiply: UIButton!

    @IBOutlet weak var btndivide: UIButton!

    override func viewDidLoad() {
        super.viewDidLoad()
        // Do any additional setup after loading the view.
    }
```

```
@IBAction func btnaddclick(_ sender: Any) {  
    let a:String! = Number1.text  
    let b:String! = Number2.text  
    let a1:Int! = Int(a)  
    let a2:Int! = Int(b)  
    let c = a1 + a2  
    labelanswer.text = "Answer is \ \(c)"  
    print("add")  
}
```

```
@IBAction func btnsubtractclick(_ sender: Any) {  
    let a:String! = Number1.text  
    let b:String! = Number2.text  
    let a1:Int! = Int(a)  
    let a2:Int! = Int(b)  
    let c = a1 - a2  
    labelanswer.text = "Answer is \ \(c)"  
    print("subtract")  
}
```

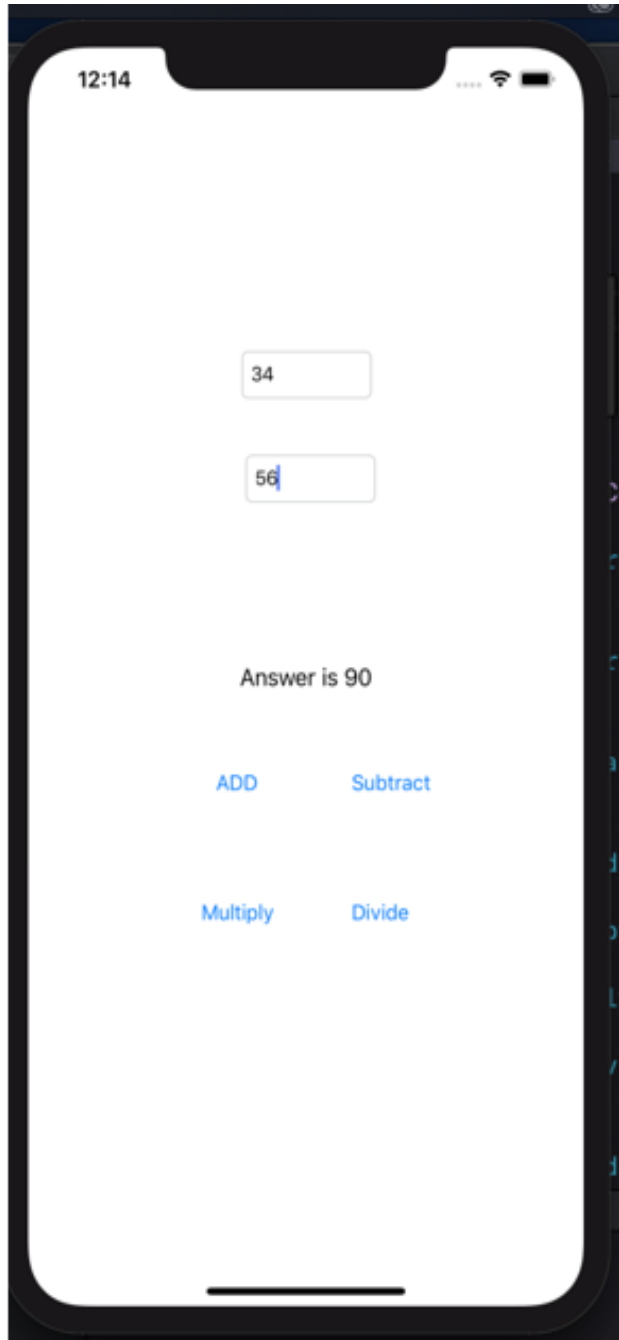

```
@IBAction func btnmultiplyclick(_ sender: Any) {  
    let a:String! = Number1.text  
    let b:String! = Number2.text  
    let a1:Int! = Int(a)
```

```
let a2:Int! = Int(b)
let c = a1 * a2
labelanswer.text = "Answer is \ \(c)"
print("multiply")
}
```

```
@IBAction func btndivideclick(_ sender: Any) {
    let a:String! = Number1.text
    let b:String! = Number2.text
    let a1:Float! = Float(a)
    let a2:Float! = Float(b)
    let c = a1 / a2
    labelanswer.text = "Answer is \ \(c)"
    print("divide")
}
}
```

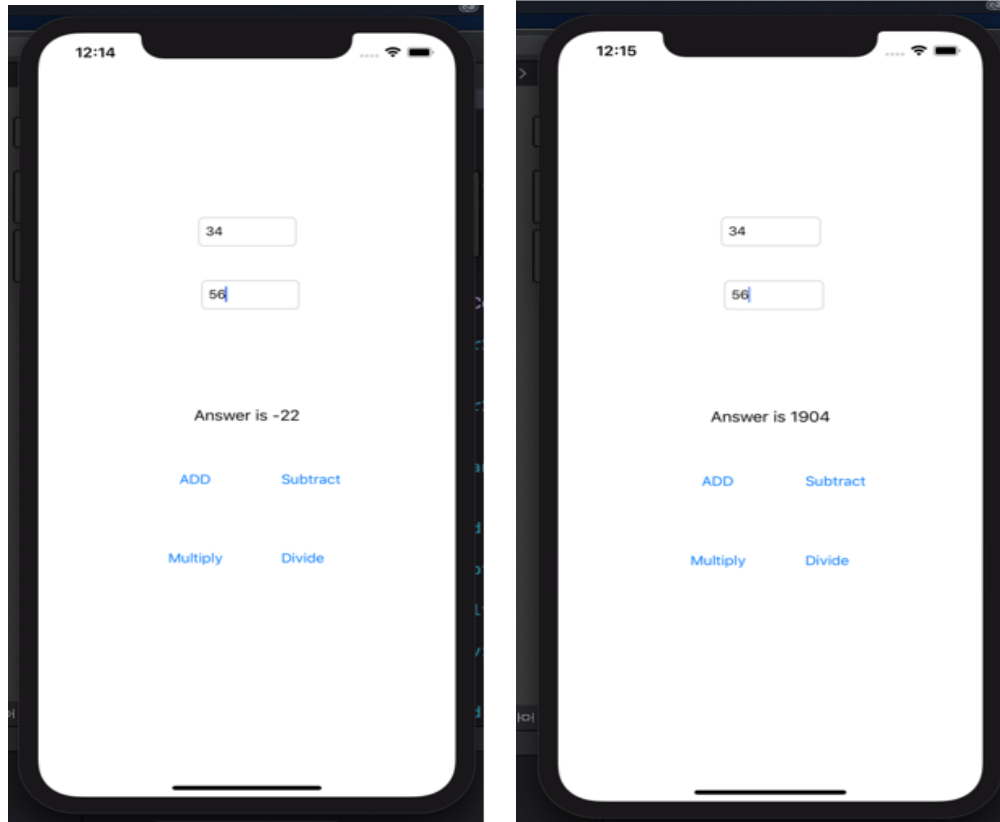

**OUTPUT:**

Addition:-

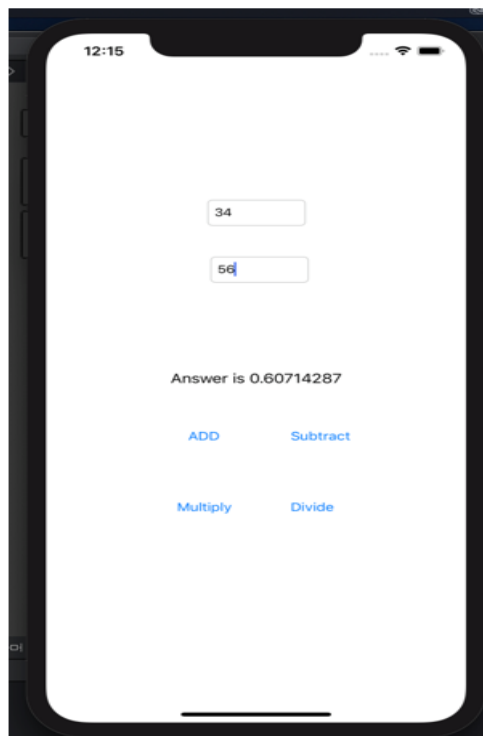

Subtraction & Multiplication:-

Division: -

**PRACTICAL-13**

**AIM: Create an I-OS Application to Change the Image Displayed on the Screen.**

**CODE:**

```
import UIKit

class ViewController: UIViewController {

    @IBOutlet weak var card: UIImageView!

    @IBOutlet weak var imgchange: UIButton!

    override func viewDidLoad() {
